August 3, 2021

## Abstract

Short introduction to your report ...

## Contents

<b>1</b>	<b>Introduction</b>	<b>1</b>
1.1	General Remarks . . . . .	1
1.2	LaTeX Resources . . . . .	2
1.3	Plagiarism . . . . .	2
<b>2</b>	<b>Haskell</b>	<b>2</b>
<b>3</b>	<b>Programming Languages Theory</b>	<b>2</b>
<b>4</b>	<b>Project</b>	<b>2</b>
<b>5</b>	<b>Conclusions</b>	<b>2</b>

## 1 Introduction

Replace Section 1 with your own short introduction.

### 1.1 General Remarks

First you need to [download and install](#) LaTeX.<sup>1</sup> Alternatively, you can use an online editor such as [Overleaf](#). I prefer to have my own installation, but to get started Overleaf may be easier.

LaTeX is a markup language (as is, for example, HTML). The source code is in a `.tex` file and needs to be compiled for viewing, usually to `.pdf`.

If you want to change the default layout, you need to type commands. For example, `\medskip` inserts a medium vertical space and `\noindent` starts a paragraph without indentation.

Mathematics is typeset between double dollars, for example

$$x + y = y + x.$$

---

<sup>1</sup>Links are typeset in blue, but you can change the layout and color of the links if you locate the `hypersetup` command.

## 1.2 LaTeX Resources

I start a new subsection, so that you can see how it appears in the table of contents.

- This is how you itemize in LaTeX.
- I think a good way to learn LaTeX is by starting from this template file and build it up step by step. Often stackoverflow will answer your questions. But here are a few resources:
  1. [Learn LaTeX in 30 minutes](#)
  2. [LaTeX – A document preparation system](#)

## 1.3 Plagiarism

To avoid plagiarism, make sure that in addition to [PL] you also cite all the external sources you use.

## 2 Haskell

This section will contain your own introduction to Haskell.

To typeset Haskell there are several possibilities. For the example below I took the LaTeX code from [stackoverflow](#) and the Haskell code from [my tutorial](#).

---

```
-- run the transition function on a word and a state
run :: (State -> Char -> State) -> State -> [Char] -> State
run delta q [] = q
run delta q (c:cs) = run delta (delta q c) cs
```

---

This works well for short snippets of code. For entire programs, it is better to have external links to, for example, Github or [Replit](#) (click on the "Run" button and/or the "Code" tab).

## 3 Programming Languages Theory

In this section you will show what you learned about the theory of programming languages.

## 4 Project

In this section you will describe a short project. It can either be in Haskell or of a theoretical nature,

## 5 Conclusions

Short conclusion.

## References
